                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR37215;
                                                                                               This sequence represents an interleukin-6 (IL-6) receptor. Varien the receptor lacking either the immunoglobulin-like domain or the transmembrane and intracellular domain have IL-6 binding ability signal transfer ability. Either the full length or truncated IL-6 signal transfer ability. Either the full length or truncated IL-6 receptors may be used for diseases caused by IL-6 such as multiply
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    JP05091892-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IL-6 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           13-SEP-1993
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            02-OCT-1991;

The present invention describes a composition (I) comprising a recombinant DNAX cytokine receptor subunit-2 (DCRS2) polypeptide. The DCRS2 polypeptide is useful for binding ligands and for preparing antibodies. The DCRS2 polypeptide is also useful for modulating cell proliferation, for diagnostic and therapeutic applications, for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB36655

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               presence of their ligands and in drug screening assays. It is also useful for treating conditions such as immunological disorders. The present sequence represents a cytokine receptor subunit protein which is given in an alignment of various cytokine receptor subunits in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                         inflammation; apoptosis; erythropoiesis; peripheral arterial disease; cancer; ischaemia; coronary arterial disease; inflammatory condition; rheumatoid arthritis; reperfusion injury; neonatal stress; infection; stroke; preeclampsia; atherosclerosis; cystic fibrosis; wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 468 AA;

Fragments of IL-6 are used in the method of the cc invention. The specification describes a method for inhibiting or comprises administering to a human patient a soluble active agent which cc inhibits ointeraction between human IL-6 and hepatocytes, and so inhibits cation of glycoprotein 130 (gpl30) and the internalisation of HBV cc into the hepatocytes. The soluble agent is selected from glycoprotein 80 (gp80), or its portion spanning amino acids 113-23 and having receptor cc sites that interact with IL6 and competitively inhibit interaction between IL-6 and hepatocytes; glycoprotein 130 (gpl30), or its portion cc spanning amino acids 1-94 and 141-230 and having receptor interact with IL-6 and competitively inhibit interaction between IL-6 and competitively inhibit interaction between IL-6 and competitively inhibit interaction acids 1-94 and 141-230 and having receptor sites that interact with IL-6 and competitively inhibit interaction between IL-6 and competitively inhibit interaction between IL-6 and competitively inhibit interaction acids 1-94 and 141-230 and having receptor sites that interaction between IL-6 and competitively inhibit interaction acids 1-94 and 141-230 and having receptor sites that complete sites IL-6 and competitively inhibit interaction between IL-6 and competitively inhibit interaction combined betal and betal IL-6 mutant. The method is used to and/or a combined betal and betal IL-6 mutant. The method is used to

                                                                                                                                                                                                                                                                                                                                                                     GR molecule. Administration of the fusion protein results in the increased expression of one or more of MIP-lalpha, MIP-lbeta, RANTES or IP-10. Also claimed are a nucleic acid molecule encoding the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein in the host cell. The fusion protein, nucleic acid or vector can be used in the manufacture of a medicament for the prophylaxis or treatment of an infectious disease (especially AIDS caused by a M-trophic strain of HIV, or bacterial peritonitis), an inflammatory disorder or an immunological disorder (especially rheumatoid arthritis), when it is desirable to increase or resolve an immune response (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the protein sequence of the human interleukin-6 receptor (IL-6R). A soluble receptor is obtained either through proteolytic cleavage or differential mRNA splicing splicing of IL-6R (see ABP72698). The present invention relates to a fusion protein (see ABP72702) comprising a functional IL-6 molecule and a functional DS-sIL-ABP72702)
                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Fig 2; 46pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240
```

The invention describes a composition of matter (1) comprising a substantially pure or recombinant DNAX cytokine receptor subunit 2 (DCRS2) polypeptide, a natural DCRS2 polypeptide, or a fusion protein comprising a DCRS2 sequence. A composition of matter comprises: a substantially pure or recombinant DCRS2 polypeptide comprising at least three distinct nonoverlapping segments of at least four amino acids

An agonist or antagonist of a mammalian DCRS2 is useful for modulating physiology or development of a cell or cell culture. Antibodies to a DCRS2 can be used for quantitative detection of interferon. The DCRS2 polypeptides and nucleic acids and their binding agents are potentially useful in treating and diagnosing disease, especially disease associated with the immune system. This is the amino acid sequence of human interleukin 6 (IL-6) receptor subunit alpha used in a comparision with

```
The invention concerns production of antagonists to any cytokine that cutilizes an alpha specificity determining component, which when combined with the cytokine, binds to a first beta signal transducing component to form a non-functional intermediate which then binds to a second beta calphal transducing component causing beta-receptor dimerization, the cytokine alpha specificity determining component of the receptor (sr-calpha) and the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form components are shared by cytokines such as antagonist to the cytokine by cytokines to form a non-functional complex. The receptor components are shared by cytokines such as the CNTF (ciliary neurotrophic development of II-6 antagonists, as they show that if, in the presence of a ligand, a non-functional intermediate complex, consisting of the cytokine component formed, it will effectively block the action of the ligand, its alpha recepotr and its beta-1 receptor component, can be consists of the alpha specificity determining components of the extracellular domains of the ligand. Effectivel components of the extracellular domains of specificity determining components of the cytokine inaccessibile to form a signal transducing components of the resultant component are useful for treating cytokine-related diseases or consorders such as osteoporosis and primary and secondary effects of cancer including multiple myeloma or cachexia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC component of the cytokine receptor (beta-1) are combined to form CC chindingris (sR-alpha:beta-1) that act as antagonist to the cytokine by CD binding the cytokien to form a non-functional complex. The receptor CC components are shared by cytokines such as the CNTF (ciliary neurotrophic CC factor) family of cytokines. The invention provides the basis for the CC development of IL-6 antagonists, as they show that if, in the presence of CC a ligand, a non-functional intermediate complex, consisting of the CC ligand, it will effectively block the action of the ligand. Effective antagonists of IL-6 or CNTF consist of heterodimers of the extracellular CC domains of the alpha specificity determining components of their cceptors and the extracellular domain of gpl30. The resultant CC receptors and the extracellular domain of gpl30. The resultant CC inaccessbile to form a signal transducing complex with the native componence bound forms of their receptor. The nucleic acids and CC polypoptides are useful for treating cytokine-related diseases or CC disorders such as osteoporosis and primary and secondary effects of cancer including multiple myeloma or cachexia

Inhibition of expression of the II-6 receptor it useful in the treatment of kidney tumours, myeloma, Kaposi's sarcoma, rheumatoid arthritis, psoriasis and endotoxic shock. The antisense oligonucleotides are administered at a dosage of 0.1-100mg/kg, pref. O.:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anti-sense oligo:nucleotide inhibitor against human IL-6R expression for treatment of e.g. tumours, cancers, rheumatoid arthritis, psorias endo:toxic shock, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-DEC-1994;

                                                                                                                                                                                                                                                                                                       The present sequence is the protein sequence of a soluble form of the human interleukin-6 receptor (II-6R), denoted PC-sII-6R, produced by proteolytic cleavage. A fusion protein of human II-6 and PC-sII-6R increases expression of MCP-1, but unlike a novel fusion protein of the invention (see ABP72702) comprising II-6 and DS-sII-6R, does not increase expression of MIP-lalpha, MIP-lbeta, RANTES or IP-10. The invention explates to this novel fusion protein and its use in the prophylaxis or relates to this novel fusion protein and its use in the prophylaxis or treatment of an infectious disease (especially AIDS caused by a M-trophi strain of HIV, or bacterial peritonitis), an inflammatory disorder or an immunological disorder (especially rheumatoid arthritis), when it is desirable to increase or resolve an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New fusion protein having a functional IL-6 and DS-sIL-6R molecule, useful for the manufacture of a medicament for the prophylaxis or treatment of an infectious disease, and an inflammatory or immunolog disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; interleukin-6; receptor; PC-sIL-6R; antibacterial;

                                                S
                                                                                                                                                                                                                                                                                   The invention concerns production of antagonists to any cytokine that utilizes an alpha specificity determining component, which when combined CC with the cytokine, binds to a first beta signal transducing component to CC form a non-functional intermediate which then binds to a second beta CC signal transducing component causing beta-receptor dimerization, the Soluble alpha specificity determining component of the receptor (SR-alpha) and the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form CC components are shared by cytokines such as the CNTF (ciliary neurotrophic factor) family of cytokines. The inventional complex. The receptor components are shared by cytokines such as the CNTF (ciliary neurotrophic factor) family of cytokines. The inventional provides the basis for the CR algand, a non-functional intermediate complex, consisting of the ligand, its alpha recepotr and its beta-1 receptor component, can be CR formed, it will effectively block the action of the ligand. Effective antagonists of the stracellular components of the extracellular domains of the alpha specificity determining components of the extracellular ceptors and the extracellular domain of gpl30. The resultant component bound forms of their receptor. The nucleic acids and CC membrane-bound forms of their receptor. The nucleic acids and conserving multiple myeloma or cachexia
                                                                                                                      Query Match

                         Isolated nucleic acid molecule for treating cytokine-related diseases disorders encodes a fusion polypeptide capable of binding a cytokine t form a nonfunctional complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Soluble IL-6-R-alpha; cytokine; antagonist; CNTF; receptor; fusion protein; cytostatic; immunomodulator; osteopathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                component of the cytokine receptor. The cytokine is an interleukin (IL-1, IL-2, IL-3, IL-4, IL-5 or II-15), granulocyte macrophage colony-stimulating factor (GM-CSF), gamma-interferon or transforming growth factor-beta (TGF-beta). The antagonist is capable of binding the cytokine to form a nonfunctional complex. The compounds have therapeutic activity as cytokine antagonists and can also be used in assays for identifying novel agonists and antagonists of cytokines
                                                                                                                                                                                                                                                                                                  25-SEP-1998;

Example 4; Fig 15; 152pp; English
```

The invention concerns production of antagonists to any cytokine that cutilizes an alpha specificity determining component, which when combined component productions of the cytokine beta signal transducing component to component to component a non-functional intermediate which then binds to a second beta component transducing component causing beta-receptor dimerization, the component of the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form component of the cytokine receptor (beta-1) are combined to form component of the cytokine by chinding the cytokine to form a non-functional complex. The receptor components are shared by cytokines such as the CNTF (ciliary neurotrophic factor) family of cytokines. The invention provides the basis for the cytokine of II-6 antagonists, as they show that if, in the presence of component, it will effectively block the action of the ligand. Effective components of the extracellular domain of gpl30. The resultant components of the alpha specificity determining components of the extracellular domain of gpl30. The resultant componers, function as high-affinity traps, rendering the cytokine components are useful for treating cytokine-related diseases or component such as osteoporosis and primary and secondary effects of cancer including multiple myeloma or cachexia

                                                                                                                                                                                                                                                                                                                                                                                           The BSF2 receptor is derived from a monocyte U937 cell line. It can used to develop prophylactic and therapeutic pharmaceuticals, as age relate diseases and disorders to abnormal BSF-2 prodn. It can also used to study an immune mechanism with which BSF-2 or the receptor concerned. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         25-MAR-2003

differential mRNA splicing. The invention relates to a fusion protein (see ABP72702) comprising a functional II-6 molecule and a functional DS-SIL-6R molecule. Administration of the fusion protein results in the increased expression of one or more of MIP-labeta, MIP-labeta, RANTES or IP-10. High levels of MIP-labha, MIP-labeta and RANTES complete with HIV for binding to CCR5 and effectively suppress HIV entry. The fusion protein can be used in the treatment of any disease in which the invention also provides a nucleic acid molecule encoding the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein in the host cell. The fusion protein, nucleic acid or vector can be used in the manufacture of a medicament for the prophylaxis or treatment of an infectious disease (especially AIDS caused by a M-trophic strain of HIV, or bacterial peritonitis), an inflammatory disease or resolve an immune response (claimed) when it is desirable to increase or resolve an immune response (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                  This is a previously reported amino acid sequence for human interleukin-6 (C (hIL-6) receptor alpha. The invention relates to the finding that hIL-6 c is essential for hepatitis B virus (HBV) infection. The invention CC is essential for hepatitisal composition for the treatment of HBV infection, comprising a soluble active agent that interacts with at least one of the binding sites between hIL-6 and the pSI region of HBV and between hIL-6 and hepatocytes and other HBV-permissive cells. The active agent competitively binds to at least one of these sites and thereby prevents thIL-6-mediated HBV infection of hepatocytes and other HBV-permissive cells. The soluble active agent is selected from glycoprotein 80 (gy80) having receptor sites which interact with hIL-6, bill-6 derived competide Gln53-His165, a combined 1 and 2 hIL-6 mutant (mhIL-6 1+2), and mill-6 legislituted with Phel71 to Leu and Ser177 to Arg, and mixtures

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δ
This sequence represents the SR345 protein. The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the cDNA. The vector contains DNA encoding a secretable functional protein with antigenicity and binding affinity, and a cDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is
                                                                                                                                                                                                                                                                                                                                                          Efficient and selective isolation of a gene encoding membrane puwith low or no antigenic binding activity, for diagnosis, study production of drugs treating abnormal functions of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene isolation; membrane-bound protein; fusion protein; drug production; antigen-binding cell; secretable functional protein; antigenic protein; protein isolation; diagnosis; SR345 protein.

(KISH/) KISHIMOTO T.

Claim Page 40; English

The BSF2 receptor has amino acids at the C-terminal deleted. The receptor is derived from a monocyte U937 cell line. It can be used to develop prophylactic and therapeutic pharmaceuticals, as agents to relate diseases and disorders to abnormal BSF-2 prodn. It can also be used to

```
cc cytokine II-6 to form a non-functional complex. The invention concerns cc production of antagonists to any cytokine that utilizes an alpha cc production of antagonists to any cytokine when combined with the cytokine, combined to a first beta signal transducing component to form a non-cc functional intermediate which then binds to a second beta signal cc alpha specificity determining component of the receptor (s. Falpha) and cc alpha specifically are demain of the first beta signal transducing component combined to form heterodimers (s. cc alpha; beta-1) that act as antagonist to the cytokine by binding the cytokine by cytokine to form a non-functional complex. The receptor components are cytokines. The invention provides the basis for the development of II-c fattagonists, as they show that if, in the presence of a ligand, a non-functional intermediate complex, consisting of the ligand, its alpha cc functional intermediate complex, consisting of the ligand, its alpha cc fectively block the action of the ligand. Effective antagonists of the action of the ligand. Effective antagonists of the extracellular domains of the apphance of correct it will consist of heterodimers of the extracellular domains of the alpha corrections of the cytokine in accessibile to form a signal correction of the intermediate complex with the native membrane-bound forms of their corporations and the cytokine-related diseases or disorders such as osteoporosis and primary corporations and secondary effects of cancer including multiple myeloma or cachexia corporations and primary corporations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABW02178

The invention is useful for identifying agonists or antagonists of cytokine receptors for treating cytokine-related diseases or disorders e.g. cancer, cachexia, arthritis and osteoporosis. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecules encoding fusion polypeptides capable of binding a cytokine to form a non-functional complex, useful for treating cytokine-related diseases or disorders, e.g. cancer, cachexia, arthritis.
IL-6 trap; cytokine; antagonist; CNTF; re
cytostatic; immunomodulator; osteopathic.
                                                                                                                                                                                                                                                                        AAY92204 standard; protein; 1168 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1158

This sequence shows fusion polypeptide 412, which is capable of binding cytokine II-6 to form a non-functional complex. The invention concerns croduction of antagonists to any cytokine that utilizes an alpha compendicity determining component, which when combined with the cytokine, binds to a first beta signal transducing component to form a non-cross functional intermediate which then binds to a second beta signal component causing beta-receptor dimerization, the soluble calpha specificity determining component of the receptor (sR-alpha) and the extracellular domain of the first beta signal transducing component of the extracellular domain of the first beta signal transducing component continues to the cytokine such as antagonist to the cytokine by binding the cytokine to form a non-functional complex. The receptor components are cytokine to form a non-functional complex. The receptor components are cytokines. The invention provides the basis for the development of II-c fanctional intermediate complex, consisting of the ligand, its alpha creceptor and its beta-1 receptor component, can be formed, it will conclinate the action of the ligand. Effective antagonists of II-c extracellular domain of gpl30. The resultant heterodimers, function as high-affinity traps, rendering the cytokine inaccessbile to form a signal cytokine-related diseases or disorders such as osteoporosis and primary and secondary effects of cancer including multiple myeloma or cachexia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           12-FEB-2004
                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a novel fusion polypeptide capable of binding a cytokine to form a nonfunctional complex. The invention is useful for identifying agonists or antagonists of cytokine receptors for treating cytokine-related diseases or disorders e.g. cancer, cachexia, arthritis and osteoporosis. The present sequence is human cytokine trap protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    N-PSDB;

The invention relates to selecting or designing a compound that interacts with the interleukin-6 receptor (IL-6R) via assessing and obtaining the stereochemical complementarity between the compound and a topographic region of the receptor and testing the compound for its ability to modulate an activity associated with the receptor. Also disclosed is the crystal structure of the IL-6R alpha chain. The compounds of the
                                                                                                                                                                                                               WPI; 2003-558820/52.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention act as cytokine receptor modulators and may be useful in the prevention and treatment of diseases associated with signalling by II-6R such as multiple myeloma, lymphoma, inflammation, rheumatoid arthritis, prostate cancer, Castleman's disease, AIDS, mesangial proliferative glomerulonsphritis, Kaposi's sarcoma, sepsis, osteoporosis and psoriasis. The method provides enhanced stereochemical complementarity relative to the naturally occurring II-6 receptor ligand as well as a rational basis for the development of ligands for specific therapeutic applications. The information provided by the II-6R crystal structure will facilitate a more accurate understanding of how the binding of a ligand leads to signal transduction. The current sequence is that of the human II-6R alpha chain wild-type protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                             Hybrid peptide; malaria parasite; Plasmodium falciparum; red blood cell; cytokine receptor; glycophorin binding pe GBP 130; GBPH; glycophorin binding peptide homologue; gly

R70103-25 are examples of CC these hybrid peptides. R70122 is a fusion of interleukin 6 receptor (as CC confirmed with reference to SWISSPROT, as it is unclear in the CC specification whether this sequence is IL6-R or IL8-R type1) and CC glycophorin binding protein (GBP) 130. The use of cytokine receptors not CC confirmed without deleterious effect. The RBC protects the hybrid peptides from RBC without deleterious effect. The RBC protects the hybrid peptides from CC excretion from the kidney, and due to steric hindrance prevents the excretion from the prefd. malaria parasite peptides used, others include homologue) are the prefd. malaria parasite peptides used, others include CC surface antigen) and the Duffy binding antigen), PMVSA (pre major merozoite surface antigen) and the Duffy binding receptor molecule (eg. exhibited by Plasmodium vivax). These peptides hind to pref. glycophorin A, B and CC c, sialo glycoproteins, found on the surface of RBCs. The hybrid peptides CC are thus used to lower the levels of free cytokines in the circulation to reduce pathological damage. (Updated on 25-MAR-2003 to correct PN field.)                                                                                                                                                                          interact
```

```
The invention relates to selecting or designing a compound that interacts with the interleukin-6 receptor (IL-6R) via assessing and obtaining the stereochemical complementarity between the compound and a topographic region of the receptor and testing the compound for its ability to modulate an activity associated with the receptor. Also disclosed is the crystal structure of the IL-6R alpha chain. The compounds of the invention act as cytokine receptor modulators and may be useful in the prevention and treatment of diseases associated with signalling by IL-6R such as multiple myeloma, lymphoma, inflammation, rheumatoid arthritis, prostate cancer, Castleman's disease, AIDS, mesangial proliferative glomerulonephritis, Kaposi's sarcoma, sepsis, osteoporosis and psoriasis.
                                                                                                                                                                  Selecting or designing compound interacting with interleukin receptor, useful for treatment of e.g. AIDS, involves assessing and testing compound to modulate activity of receptor.
                                                                                                                                                                                                                                           Varghese JN,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The method provides enhanced stereochemical complementarity relative to the naturally occurring II-6 receptor ligand as well as a rational basis for the development of ligands for specific therapeutic applications. The information provided by the II-6R crystal structure will facilitate a more accurate understanding of how the binding of a ligand leads to signal transduction. The current sequence is that of the human II-6R alpha chain mutant protein of the invention which contains a V2590 substitution. Note: The present sequence is not shown within the specification but was created by the indexer using the human II-6R alpha chain wild-twne protein accurance (ANO-2714)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human interleukin 6 receptor alpha chain mutant peptide -
                                                                                                                                                                                                                                                                                                                                                                                                                                 nephrotropic; osteopathic; antipsoriatic; interleukin-6 receptor; II-6R; alpha chain; cytokine; multiple myeloma; lymphoma; inflammation; sepise; rheumatoid arthritis; prostate cancer; Castleman's disease; AIDS; human; mesangial proliferative glomerulonephritis; Kaposi's sarcoma; psoriasis;
